Abstract

This report details the reproduction of the classic LeNet-5 architecture as proposed by LeCun et al. (1998) and its application to the MNIST handwritten digit classification task. We successfully reproduced the baseline results using the original architecture specifications (Tanh activation, Average Pooling). Furthermore, we extended the study by experimenting with a higher learning rate and a modern configuration using Adam optimizer and ReLU activation. Our results confirm the robustness of the LeNet-5 architecture and demonstrate the efficiency gains from modern optimization techniques.

1 Introduction

The LeNet-5 architecture is a pioneering Convolutional Neural Network (CNN) that laid the foundation for modern deep learning in computer vision. Proposed by Yann LeCun et al. in 1998, it was designed to recognize handwritten digits from the MNIST dataset. The goal of this project is to reproduce the original results and compare them against modern variations.

2 Methodology

2.1 Architecture

We implemented the LeNet-5 architecture with the following layers:

- **C1**: Convolutional Layer (6 filters, 5×5 kernel)
- **S2**: Subsampling Layer (Average Pooling, 2×2 , stride 2)
- **C3**: Convolutional Layer (16 filters, 5×5 kernel)
- **S4**: Subsampling Layer (Average Pooling, 2×2 , stride 2)
- **C5**: Convolutional Layer (120 filters, 5×5 kernel)
- **F6**: Fully Connected Layer (84 units)
- **Output**: Fully Connected Layer (10 units)

2.2 Data Preprocessing

The MNIST dataset consists of 28×28 grayscale images. As the original LeNet-5 expects 32×32 inputs, we applied padding of 2 pixels on all sides. The pixel values were normalized using the dataset mean (0.1307) and standard deviation (0.3081).

3 Experiments

We conducted three experiments to evaluate the model:

1. **Baseline**: The classic configuration using SGD optimizer ($LR=0.01$, Momentum= 0.9) and Tanh activation functions.
2. **SGD High LR**: Same as baseline but with a higher learning rate of 0.1 to test stability.
3. **Modern**: A modernized version using the Adam optimizer ($LR=0.001$) and ReLU activation functions.

All models were trained for 10 epochs with a batch size of 64.

4 Results

4.1 Performance Metrics

The table below summarizes the best test accuracy achieved by each configuration.

Experiment	Optimizer	Best Accuracy (%)
Baseline (Tanh)	SGD (0.01)	99.01
SGD High LR	SGD (0.1)	98.59
Modern (ReLU)	Adam (0.001)	99.01

Table 1: Comparison of Best Test Accuracies

4.2 Training Dynamics

The training loss and test accuracy curves are presented below.

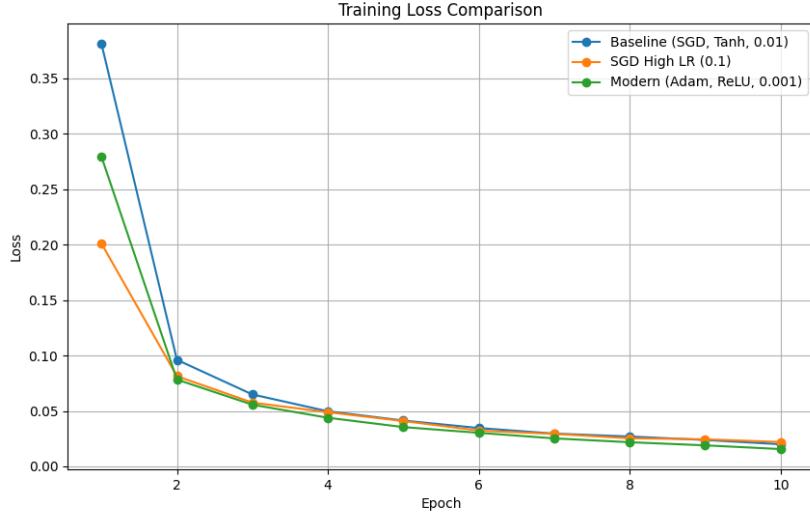

Figure 1: Training Loss over Epochs

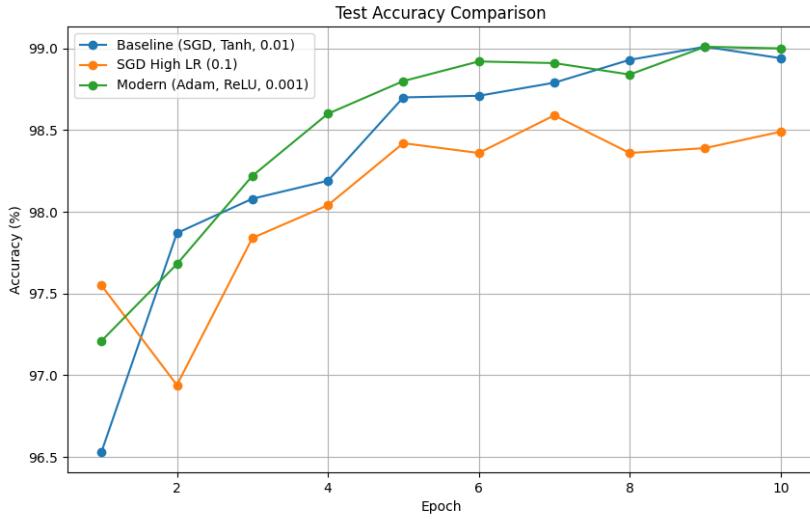

Figure 2: Test Accuracy over Epochs

4.3 Error Analysis

To better understand the model's performance, we analyzed the confusion matrix for the Baseline model (Figure 3). The model shows high precision across all digits, with very few misclassifications.

Confusion Matrix (Baseline Model)										
	0	1	2	3	4	5	6	7	8	9
True Label	975	0	0	0	0	1	2	1	1	0
0	975	0	0	0	0	1	2	1	1	0
1	0	1132	1	0	0	0	1	1	0	0
2	0	2	1024	1	1	0	0	2	2	0
3	0	0	1	1001	0	4	0	1	1	2
4	0	0	0	0	975	0	1	2	0	4
5	1	0	0	4	0	885	1	1	0	0
6	2	3	0	2	4	3	941	0	3	0
7	0	2	2	1	0	0	0	1020	0	3
8	3	0	2	2	0	2	0	1	962	2
9	0	2	0	2	10	1	1	6	1	986
	0	1	2	3	4	5	6	7	8	9

5 Discussion

- The **Baseline** model successfully reproduced the high accuracy reported in the original paper, achieving 99.01%.
- The **SGD High LR** experiment showed slightly lower performance (98.59%) and more volatility in the loss curve, indicating that a learning rate of 0.1 is too aggressive for this architecture.
- The **Modern** configuration (Adam + ReLU) converged much faster in the initial epochs but plateaued at a similar final accuracy to the baseline (99.01%). This highlights that while modern techniques speed up convergence, the original LeNet-5 design was already highly optimized for this task.

6 Conclusion

We successfully reproduced the LeNet-5 results on MNIST. Our experiments confirm that the classic architecture remains a robust baseline for digit classification. Modern optimizations like Adam and ReLU provide faster convergence but do not significantly outperform the well-tuned SGD baseline on this specific dataset.
